

How Does It Work?

Your house water pressure is the source of the energy needed to pump excess water out of the sump pit. Once the sump water level reaches a pre-set height, the hydraulic float switch automatically activates Water Commander™. Water is quickly drawn out of the sump with a strong suction and is discharged to the exterior.

Water Commander™ is the most reliable backup sump pump you can buy. It runs without limit, providing you with unmatched protection against basement flooding.

You should not install Water Commander™ if you have a residential well as your water source, as the pressure will not be present during a power outage.

Where to Purchase Water Commander™

Authorized dealers/installers are available in most states and metropolitan areas. Call or email us to get the name of a local installer. We recommend licensed plumbers for correct installation of Water Commander™.

WATER COMMANDER™

The powerful, water-powered backup sump pump that uses no batteries or electricity.

*Industrial quality sump pumps
by Tane Corporation*

Water Commander™

Model MG 22 for 3/4" supply

Water Commander™ model MG 22 is the standard water-powered backup sump pump for most homes.

- Minimum 3/4" water supply
- From 40 PSI to 125 PSI house water pressure
- 1 1/4" PVC suction and discharge pipes.

Non-Electric

Water Commander™ uses your home's water pressure to operate – no battery or electricity is needed. It will pump as needed during power outages or primary sump pump failure. Water Commander™ will also work in tandem with your electrical sump pump if necessary in an extreme downpour.

Powerful

Water Commander™ can easily match or outpump your electric sump pump. See our pumping specifications to see just how powerful it is.

Dependable

Water Commander™ will activate and empty your sump automatically; there is no need to be home as you would if using a generator. Even if you are gone for weeks, Water Commander™ will stay on duty and operate at full power as needed.

Unlike battery backups, Water Commander™ will operate as needed for an *unlimited* amount of time. No maintenance is required. There is no future battery replacement needed. A battery backup will provide 7 to 8 hours run time when new, but loses power capacity consistently as time goes on, until the battery must be replaced after two to three years. Water Commander™ will run reliably without limit for many years.

Easy to Install

Water Commander™ is adaptable to the space available. Both the suction and discharge pipes can be turned multiple times if needed. Model MG 22 requires a minimum 3/4" water supply, which the majority of homes have. If you have a 1" or larger water supply, model MG 36 can be installed in your home.

Water Commander™ has a very powerful suction and can operate equally well in any position or orientation.

Model MG 36 for 1" supply

Water Commander™ model MG 36 is the most powerful water-powered backup sump pump available anywhere.

- Minimum 1" water supply
- From 40 PSI to 125 PSI house water pressure
- 1 1/2" PVC suction and discharge pipes
